

# Knowledge Media Blocks

Acceptance fixture for the System Modeling Foundations reader

## Purpose

This one-page PDF verifies that a versioned document asset can be delivered by the platform, displayed inside the natural reading flow, opened in a separate window, and downloaded without exposing a server filesystem path.

| Block | Source boundary                                          | Reader behavior                                                  |
|-------|----------------------------------------------------------|------------------------------------------------------------------|
| Code  | UTF-8 text inside the Knowledge Pack                     | Read, copy, and validate through the existing official validator |
| PDF   | Versioned PDF asset inside the Knowledge Pack            | Inline preview with open-in-new-window and download fallbacks    |
| Video | Allowlisted provider plus immutable video or playlist ID | External player loads only after explicit learner action         |

## Security and lifecycle checks

The pack registry validates file type and path containment before publication. The asset URL includes the pack content version, so a changed document produces a new immutable reader URL. External videos are not stored in the pack and arbitrary iframe URLs are rejected.

## Expected result

The first page is legible at desktop and mobile widths, the browser receives application/pdf, and the reader offers explicit fallback actions. This document contains no executable content and no external references.
